

AUTOMATICALLY PREPARING STREAMING
VIDEO PROGRAMMING GUIDES

Abstract of the Disclosure

A programming guide for streaming video files may be automatically compiled in response to a user request. The user may provide keywords for categories of streaming video files that are of interest. A graphical user interface is automatically developed which splits responsive streaming video files into categories requested by the user. Each streaming video file may be represented in a user selected fashion. For example, the streaming videos may be represented by a representative frame, title or other information. The user can then click on any of the streaming video files, broken down into the appropriate categories, to begin viewing a streaming video file of interest.
